HEADLINE

Revenue risk concentrated in payments infrastructure — 3 correlated failures detected in the last 6h suggest systemic degradation, not isolated incidents.

TRENDS

Webhook failure rate trending +18% week-over-week. Churn propensity scores drifting upward in mid-market segment since pricing update on 07-19.

Webhook failure rate (7d)

**RISKS**

If payment retry queue remains saturated >4h, estimated GMV loss reaches \$128K. Churn model unreliability may trigger 40+ false-positive retention emails.

OPPORTUNITIES

Consolidating 14 idle enterprise seats into a pooled license could unlock \$41K ARR in upsell conversations during Q3 renewals.

RECOMMENDED ACTIONS

1. Scale payment workers immediately (critical)
2. Pause segment B auto-emails pending retrain
3. Schedule renewal reviews for idle-seat accounts

What caused the payment timeout spike this morning?

- The spike originated from retry queue saturation at 07:12 UTC. Worker pool hit capacity after Stripe API latency increase (p99: 220ms to 1.8s).

Is it related to the churn model drift?

- No direct causal link. Churn drift stems from the pricing change on 07-19 affecting segment B features. Both compound revenue risk if unresolved.

What should I prioritize first?

- Payment workers - the \$42.8K exposure is time-sensitive. Churn model can wait 24h. Scale workers now, then schedule retrain.
