

One pane of glass for your BI + AI

Look at any dashboard. Ask it questions in plain language. Get answers grounded in your own governed data - powered by the AI your organisation already runs.

Any BI tool

Any AI brain

Your data | your governance

No new licence

WHY TEAMS LOVE IT

Stop switching tools to ask your data a question

PulsePlay puts your BI tools and your AI services behind one screen - so everyone gets the same simple, trusted experience, whatever dashboard they're looking at.

Every tool, one assistant

Power BI, Tableau, Qlik, Looker - hosted side by side under a single AI that understands what you're viewing.

Grounded & governed

Answers come from governed data with an honest trust badge. Access is allow-listed; sensitive fields are masked before any model sees them.

Bring your own brain

Genie, Foundation Models, Azure OpenAI, Bedrock, agents - 10 connector paths. Swap the AI without changing the experience.

No new licence, fast to extend

Built in-house on platforms you already own. New tool or model? A drop-in module - not a rebuild.

SOFTWARE LICENCE

Host any BI tool - vendor-agnostic by design

PulsePlay is the **host**, not a plugin trapped inside one vendor's surface. Your existing dashboards run inside one screen, embedded securely, and the assistant reasons about whatever you're currently viewing. Change the BI tool without changing anything about the AI.

Power BI

Native SDK

Deepest integration today: a real powerbi-client embed, secure embed-token fallback, a built-in Q&A surface, and deterministic semantic-model KPIs that need no LLM call.

Tableau | Qlik | Looker

Secure embed

Hosted today through secure embedding; first-class native SDK adapters (Tableau Embedding API v3, qlik-embed, Looker embed-sdk) are on the roadmap.

Any other tool

Generic embed

The always-works escape hatch - host any URL-addressable dashboard or internal report inside a narrowed, least-privilege sandbox.

AXIS Y | WHAT YOU LOOK AT

The BI vendor

Swap the embedded dashboard tool independently of everything else. Sit it side by side with the assistant, or detach / float either pane.

Power BI

Tableau

Qlik

Looker

Any iframe

AXIS X | THE AI BRAIN

The AI connector

Swap the reasoning engine independently. Ten connector paths - and **any** combination of (BI vendor x AI brain) is valid.

Genie

Foundation Model

Azure OpenAI

Bedrock

Agents

Rendered in PulsePlay's own chrome - the native panel

One canvas, three peer tabs. AI Insights, Ask Pulse and Dashboard share the same toolbar and affordances - not the vendor's OEM chrome.

Light & dark, end to end. One coherent design-token system; a single toggle themes every native surface together.

Float & dock. Pop a pane out to inspect, then dock it back. (*Side-by-side compare is on the roadmap.*)

Secure embedding by construction

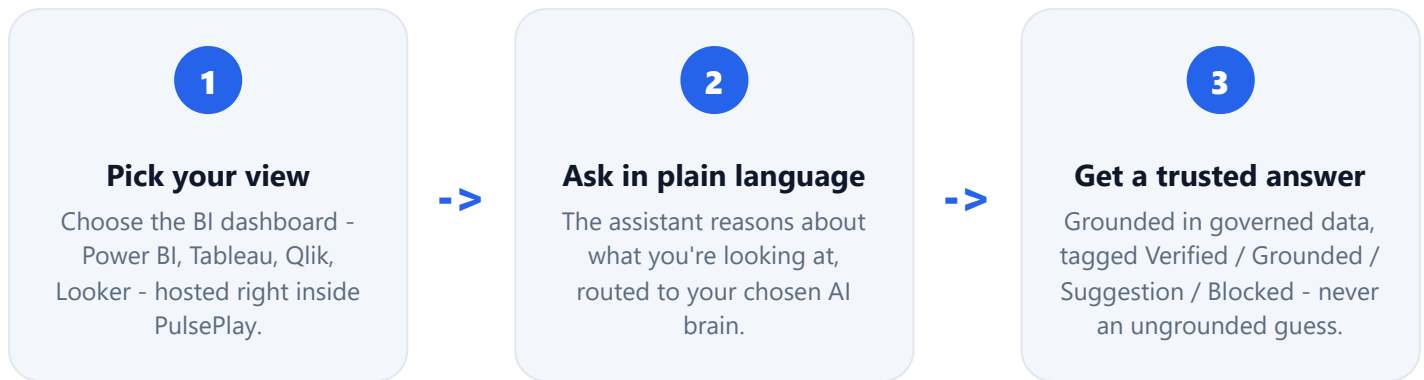

Every embed credential - Power BI embed tokens, Tableau trusted tickets, Qlik OAuth, Looker signed URLs - is minted server-side by the proxy. Nothing sensitive ever reaches the browser, and each vendor runs in the narrowest sandbox it needs.

One experience, any dashboard

Whatever the user is viewing, the assistant sees the same governed context and returns the same trusted, status-tagged answer - so analysts stop tool-hopping and platform teams govern in one place, not per tool.

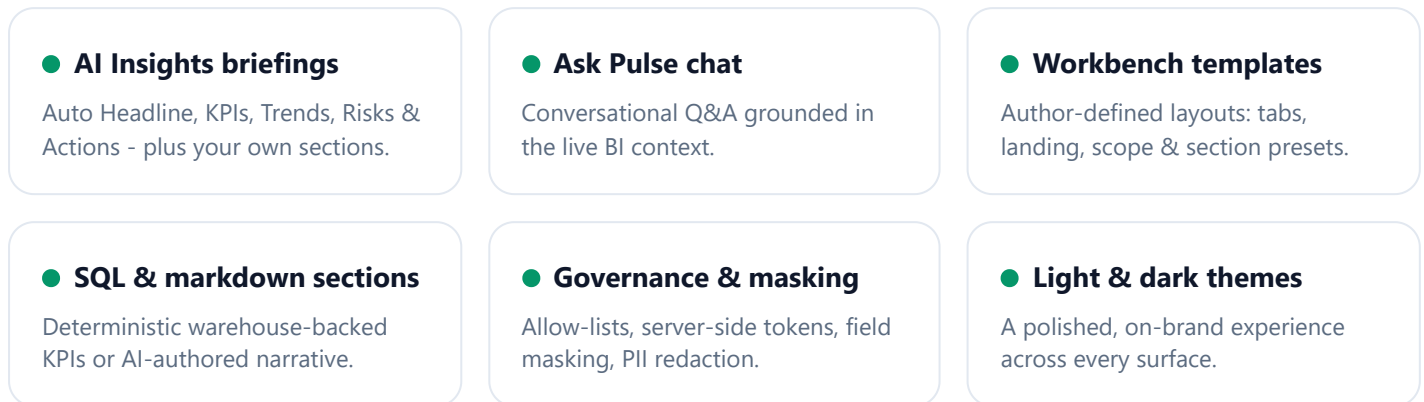

HOW IT WORKS

Three steps, one experience

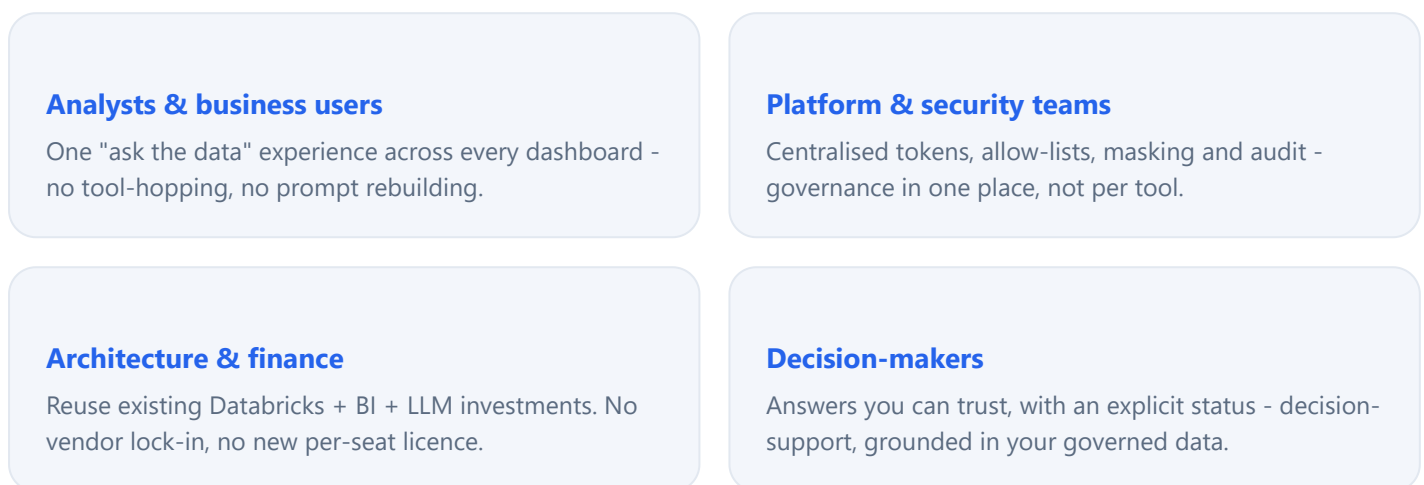

WHAT'S INSIDE

Built for the enterprise

WHO IT'S FOR

Look at anything. Ask in plain language. Trust the answer.

Your BI tools | Your AI | Your data | One screen. - Ask the platform team for a walkthrough.
